School of Computer Science and Engineering,
Vellore Institute of Technology,
Vellore, Tamilnadu, India - 632014

I - Help file

Software used/required: 1) Front end: Notepad++: Editor for both backend and frontend code
2) Database: MySQL: Used for writing the backend code.
3) Server: XAMPP: Server to locally host the website.
4) Any other requirement: Web browser: For visual interaction and input from user.

Connection string used to connect the front end with database:

In index1.html(form):

```
<form action="backend_income.php" method="post" onsubmit="return validate()">
```

Backend with database:

```
<?php
$servername = "localhost";
$username = "root";
$password = "";
// Create connection
$conn = new mysqli($servername,$username, $password);
// Check connection
if ($conn->connect_error) {
    die("Connection failed: " . $conn->connect_error);
}
echo "Connected successfully";
mysqli_select_db($conn,'income')
```

Hardware requirement: No special requirement.

Database details:

No. of tables as per the normalized schema : 17

No. of tables in the final project : 17

Front end details:

How many interface pages? : 7

Type of interface (web page/application) : Web Page + Form

How to install and test your application/web page?

Steps to install XAMPP on Windows:

- In the web browser, visit [Apache Friends](https://www.apachefriends.com/) and download XAMPP installer.

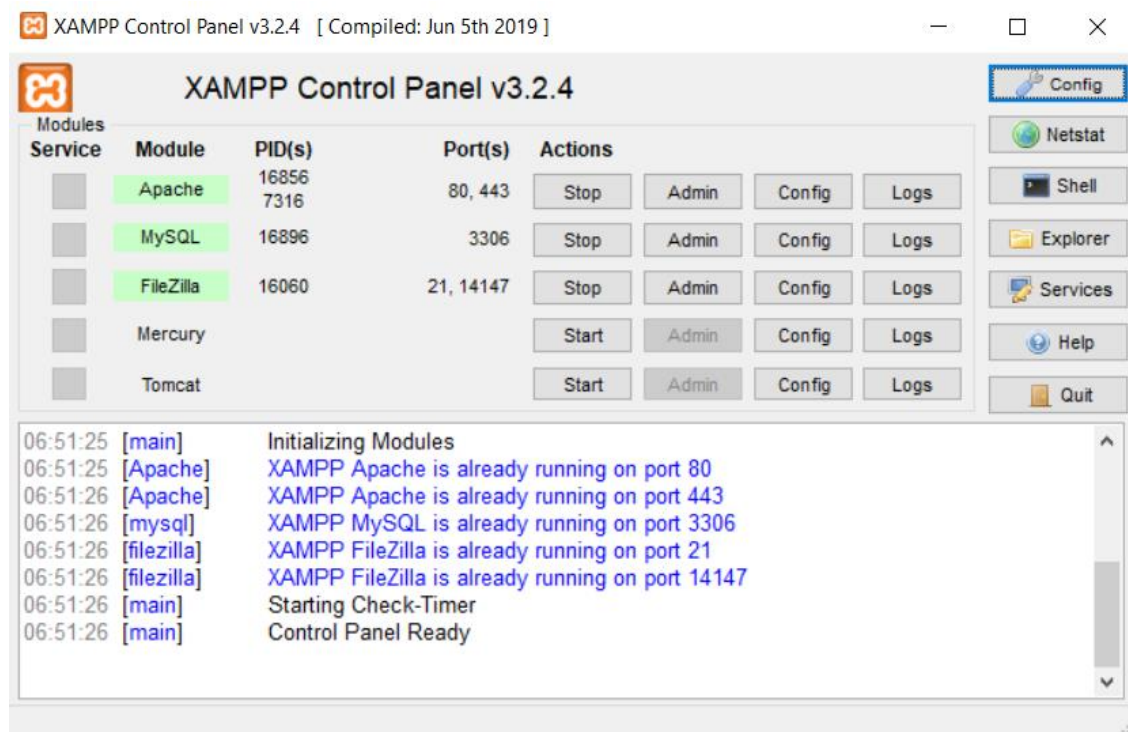

- During the installation process, select the required components like MySQL, FileZilla ftp server, PHP, phpMyAdmin or leave the default options and click the **Next** button.
- Uncheck the **Learn more about bitnami** option and click **Next** button.
- Choose the root directory path to set up the *htdocs* folder for our application. For example 'C:\xampp'.
- Click the **Allow access** button to allow the XAMPP modules from the Windows firewall.

Using Xampp:

- After the installation process, click the **Finish** button of the XAMPP Setup wizard.
- Now the XAMPP icon is clearly visible on the right side of start menu. Show or Hide can be set by using the control panel by clicking on the icon.
- To start Apache,MySQL and filezila just click on the **Start** button on the control panel.
- In XAMPP, the configuration files of Apache, MySQL, PHP are located in **C:\Program Files\xampp**. For any configuration file changes, you need to restart Apache and MySQL

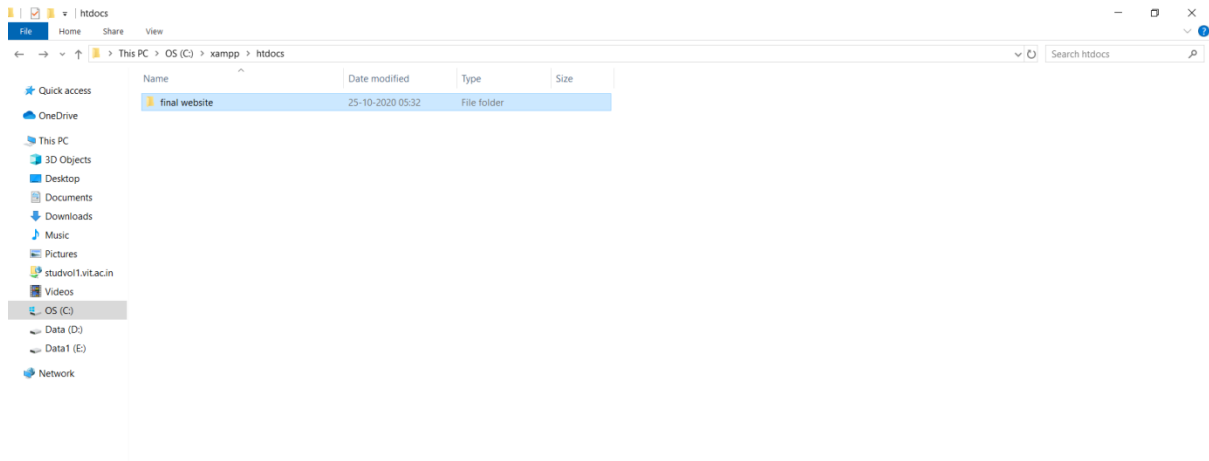

XAMPP control Panel:

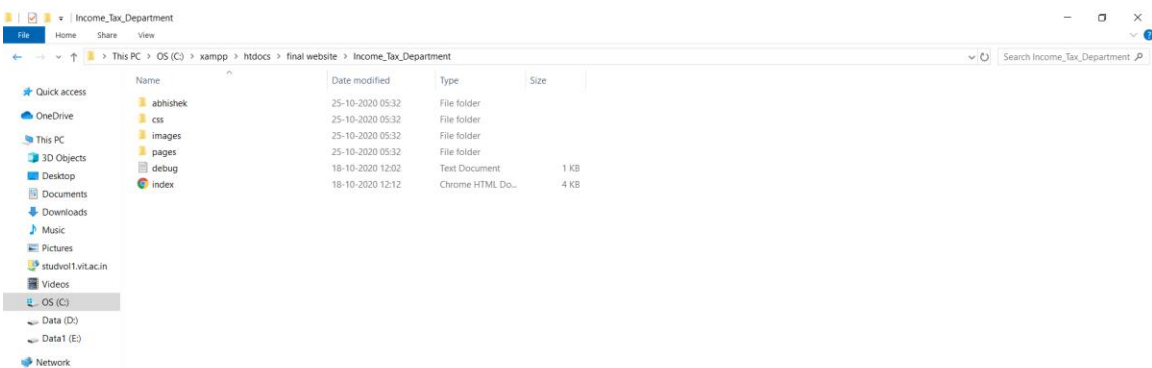

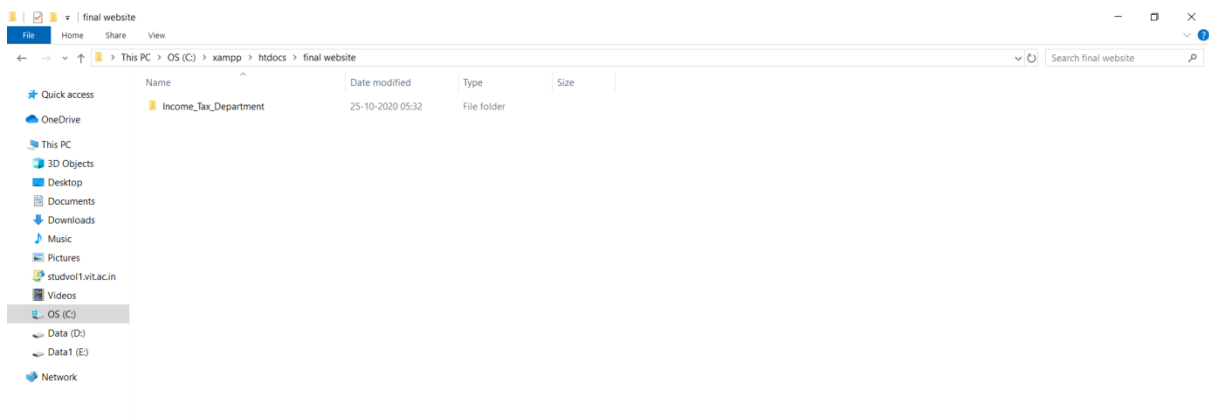

Placing the files in the right places:

For the website:

- Unzip the zipped file provided in the google form link
- Navigate to Xampp folder in the location where you installed your application.
- Go to htdocs. This is where the “final website” folder must be pasted.

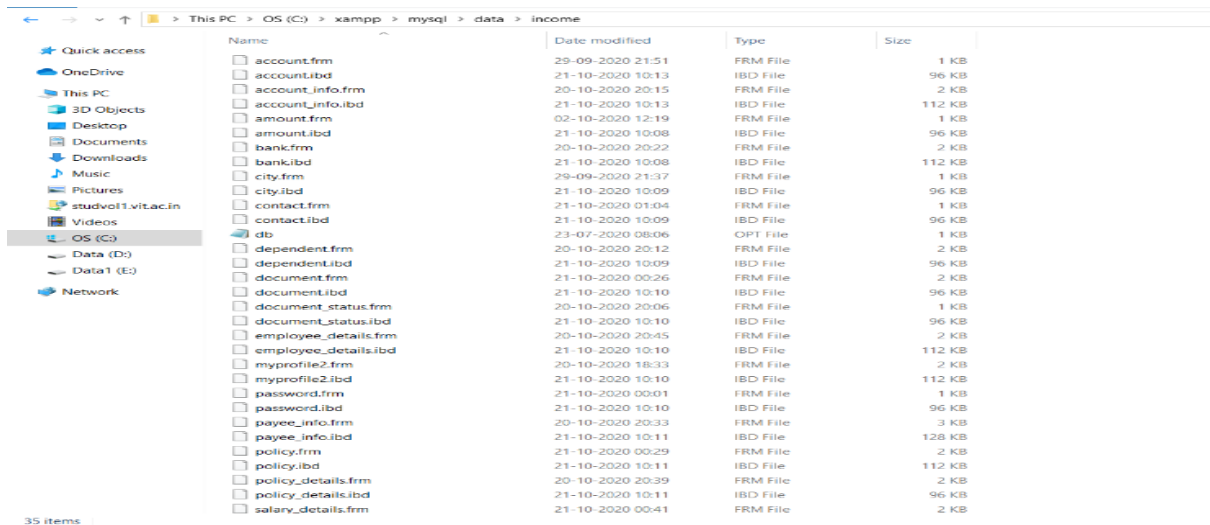

The contents of the folder final website should be:

For the database:

- Navigate to MySQL folder of Xampp.
- Click on the data folder and paste the folder “Income” attached in the google form.

salary_details.frm	21-10-2020 00:41	FRM File	2 KB

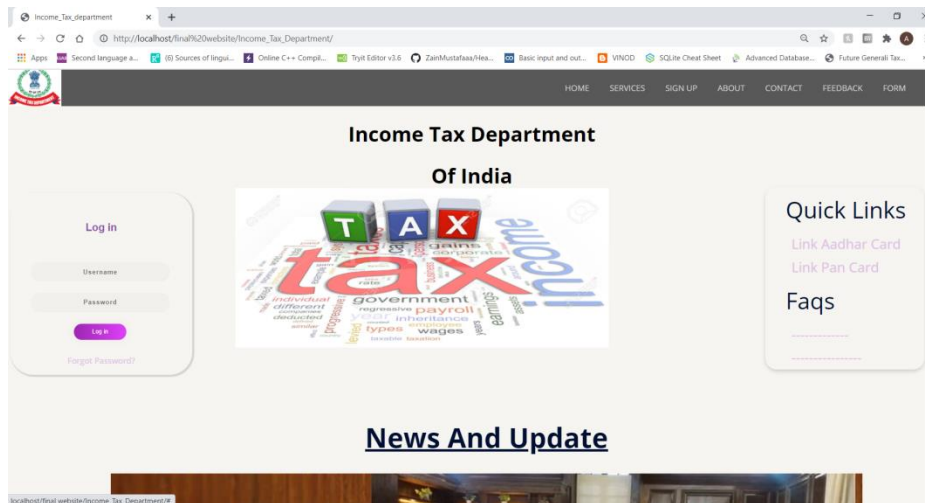

Once all the above steps are followed, our project is ready to be hosted locally on Xampp.

Hosting the website:

- Use the mentioned link to host the website: <http://localhost/final%20website/>.
- Click on “Income_Tax_Department” and the website will be visible to you.

Website:

To see the database follow the link: <http://localhost/phpmyadmin/>

ACKNOWLEDGEMENT

We take this opportunity to express our profound gratitude and deep regards to our project guide Prof. Saravanakumar K for his exemplary guidance, monitoring and constant encouragement throughout the course of this subject CSE2004: Database Management Systems that helped us to complete this project. The blessing, help and guidance given by him time to time shall carry us a long way in the journey of life on which we are about to embark.

We also take this opportunity to express a deep sense of gratitude to the management of VIT UNIVERSITY for their cordial support, valuable information and guidance, which helped us in completing this task through various stages.

Lastly, we thank the almighty, our parents, brothers, sisters and friends for their constant encouragement without which this project would not be possible.

II – Phase I report

AIM:

This task has been undertaken by the students of B. Tech Computer science and engineering for the course of "Database Management Systems" with course code CSE2004. The essential methodology of this undertaking is to make a database for Income Tax Return System and interface it to a site with the goal that constant refreshing and exchanges on database can be taken care of.

The key purpose of our Income Tax Management System is to set up Tax Returns of a client. In Tax Information Framework System, a client registers himself enters all the nuances and moves various Documents that are significant for course of action of Tax Summary and Schedules for a gathering after productive convenience of the impressive number of reports.

PROBLEM STATEMENT:

The essential point of this undertaking is to set up a Tax rundown or Tax Returns framework for a customer. In annual expense forms framework, a customer registers himself at that point enters all the subtleties and transfers different Documents that are extremely vital for planning of Tax Summary.

PROPOSED SYSTEM OVERVIEW:

In the upcoming months of the semester, we will try to extend our project to encompass the following goals:

1. Login/register

- Clients should login to our website to update their profiles and start filling the form.
- Administrator view will be provided through phpMyAdmin wherein the administrator can view the entire details of the applicant.

2. Documents

- Specify any other statements relating to the interest, dividend or stocks.

3. Accepting income tax registration form

- A basic form will be used to avail all the information regarding the person which is necessary for income tax filing.

4. Payment

- Pay the tax registration fee through our website.

In this phase we have covered 3 steps of our database design which includes the following:

- **Deciding the functional and non-functional requirements of the user.**
- **Designing the ER diagram.**
- **Converting the ER diagram to conceptual schema.**

For the upcoming Phases we shall proceed further for Normalization and Physical design and implementation for the completion of our Database.

HARDWARE AND SOFTWARE

REQUIREMENTS

This task for the ,most part, centers around the customer perspective on the database. This module will comprise of a landing page which will ask the client to Login (in the event that he as of now has enlisted). Else, he will be approached to "Sign in" with our site. Hence the site page will guide the client to the Income charge enlistment structure where he/she will be approached to enter his/her subtleties and announcements.

Hardware Requirements:

- Proper internet connection
- Laptop with enough space to accommodate a database.

Software Requirements:

- MySQL : Used for writing the backend code.
- Notepad++: Editor for both backend and frontend code
- Web browser: For visual interaction and input from user.
- XAMPP : Server to locally host the website.

DESIGNING THE CONCEPTUAL SCHEMA:

When all the necessities have been gathered and broke down, the following stage is to make an applied outline for the database, utilizing a significant level calculated information model.

The consequence of this stage is an Entity-Relationship (ER) chart. It is a progressed - level information model of use region. It gives a distinctive portrayal on how various elements or entities are identified with one another. It likewise portrays what qualities every entity set has.

Step 1: Identifying possible entities:

- I. TAX REGISTRATION
- II. DOCUMENT
- III. DEPENDENTS
- IV. BANK
- V. PAYMENT
- VI. STATUS
- VII. MY_PROFILE
- VIII. EMP_DETAILS
- IX. POLICIES
- X. TAX_BENEFIT

Step 2: Determining the appropriate matching attributes of each entity.

I. TAX REGISTRATION:

- Tax_no
- Name- composite attribute. The components of this attribute will be fname,mname and lname.
- sex
- contact_no
- User_id
- Password

II. DOCUMENT:

- Doc_id
- Doc_type
- Status: The values that will be accepted by this attribute are “accepted” or “rejected”

III. DEPENDENT:

- Tax_no-Weak entity with owner type TAX REGISTRATION
- Name: Composite attribute. The components associated with this attribute will be fname, mname and lname.
- Relation
- DOB

IV. PAYMENT:

- Tax_no
- Trans_id
- B_name
- Amount
- Date

V. BANK ACCOUNT:

- B_name
- Acc_Type
- taxid
- IFSCcode
- Acc_no

VI. STATUS:

- Tax_no
- Reg_status
- Sdate
- Status_time

VII. MYPROFILE:

- Tax_no
- Name: composite attribute. The components associated with this attribute will be fname, mname, lname.
- sex
- DOB
- Address: composite attribute. The components associated with this attribute will be city, street, state.
- Contact_no

VIII. POLICY

- P_no
- P_type
- iss_comp
- p_name
- exp_date
- iss_date
- tax_no
- p_term: derived attribute

IX. TAX BENEFIT

This is a weak entity set and is strongly dependent on POLICY

- tax_no
- p_no
- tax_bene

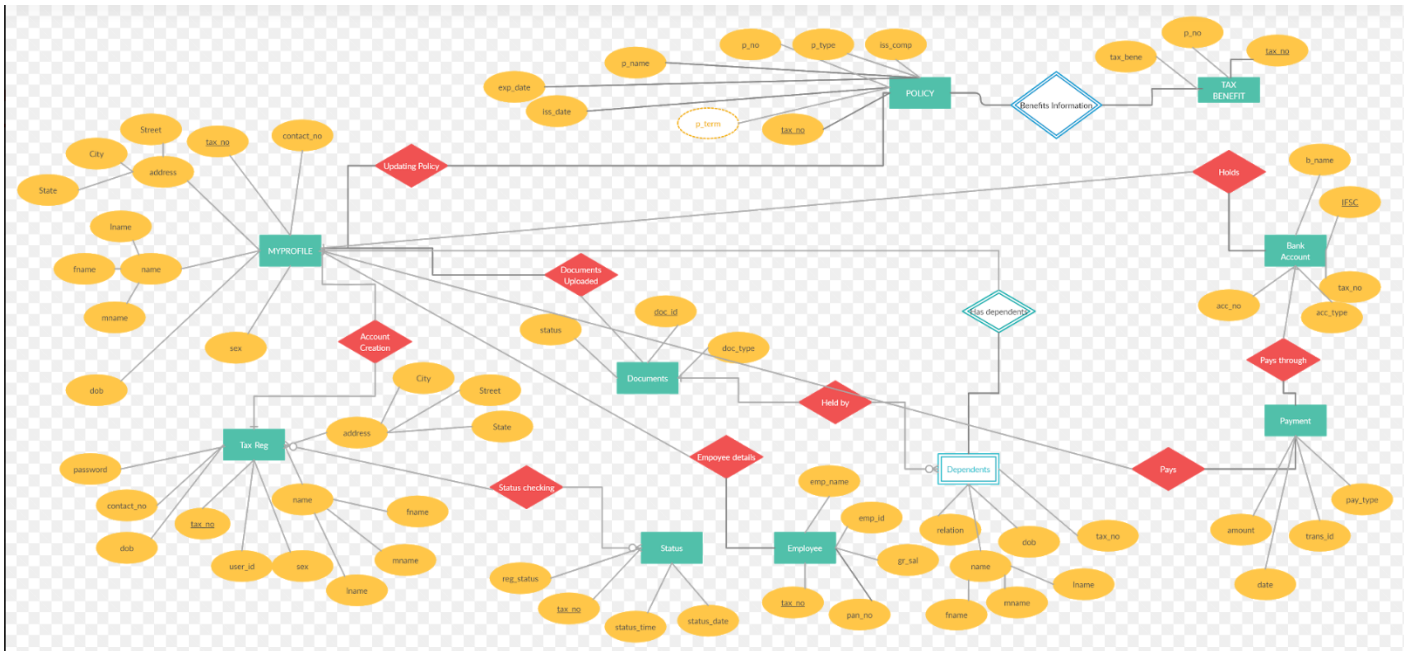

X. EMPLOYEE

- Emp_name:composite attribute:this attribute will hold the fname,mname,lname.
- Emp_id
- Gr_sal
- Tax_no
- PAN

Step 3: Fixing the relationships between the various entities in our project.

- MYPROFILE (a citizen) **registers for** TAX REGISTRATION.(1 to 1 relationship)
- MYPROFILE (a citizen) **Pays** PAYMENT.(1 to N relationship)
- MYPROFILE (a citizen) **holds** BANKACCOUNT(1 to N relationship)
- MYPROFILE (a citizen) **has** DEPENDENTS(1 to N relationship)
- MYPROFILE (a citizen) **uploads** DOCUMENTS(1 to N relationship)
- STATUS of TAX REGISTRATION(1 to 1 relationship)
- MYPROFILE **updates** his/her policy.(1 to N relationship)
- MYPROFILE **works** at EMPLOYEE (1 to N relationship)
- PAYMENT **through** BANKACCOUNT.(N to 1 relationship)
- DEPENDENTS **hold** DOCUMENTS.(1 to N relationship)
- POLICY **provides/gives** TAX_BENEFIT(1 to 1 relationship)

ER-DIAGRAM:

REDUCING THE ER DIAGRAM TO CONCEPTUAL SCHEMA:

The result of the logical design phase is a set of relation schema. The ER diagram or class diagram is the foundation for these relation schemas. The relation schemas are the basis for table definitions. There are rules how the ER model or class diagram is transferred to relation schemas.

The following are the rules that we have kept in consideration while designing the conceptual schema of our project:

- **Strong Entity sets becomes a table.**
- **All single-valued attribute becomes a column for the table.**
- **A key attribute of the entity type represented by the primary key.**
- **The multivalued attribute is represented by a separate table.**
- **Composite attribute represented by components.**
- **Derived attributes are not considered in the table.**

CONCEPTUAL SCHEMA:

- MYPROFILE (tax_no, doc_id, dob, sex, street, state, city, fname, mname, lname)
→ The 'myprofile' entity set is a strong entity set where tax_no is the primary key
- DOCUMENT(docid, dtype, status)
- DOCUMENT_STATUS(docid, status, tax_no)
- TAX_REGISTRATION(tax_no, user_id, lname, fname, mname, password)
- CONTACT(tax_no, phone)
- DEPENDENT(tax_no, fname, mname, lname, dob, relation)
→ The 'dependent' entity set is a weak entity set because it strongly depends on 'Tax Registration'. This is the reason why we have added tax_no as a foreign key in this table
- REG_STATUS(tax_no, status, s_confirmation_date)
- PAYMENT(trans_id, tax_no, b_name, acc_no, amount, date)
- BANK_ACCOUNT(acc_no, ifsc, b_name, tax_no, acc_type)
- POLICY(p_no, tax_no, iss_comp, p_type, p_name, exp_date, iss_date)
- EMPLOYEE(emp_id, emp_name, gr_sal, pan_no, tax_no)

III – Phase II report

NORMALIZING THE RELATIONAL SCHEMAS:

Here we are going to demonstrate the normalization process for table MYPROFILE:

MYPROFILE:

Tax_no	Doc_id	DOB	Fname	Mname	Lname	Sex	Street	State	City
T_0001	D_0001	11-AUG-1995	Abhishek	Rajeev	Sharma	M	enclave	Maharashtra	Thane
T_0002	D_0002	15-AUG-1992	Kaustubh	Shankar	Shrivastava	M	seawoods	Maharashtra	Mumbai
T_0003	D_0003	08-MAY-1990	Ritwik	Arvind	Sinha	M	Powai view	Maharashtra	Mumbai
T_0004	D_0004	19-JUL-1991	Alia	deepak	Patel	M	Chitoor_road	Gujarat	Surat
T_0005	D_0005	11-AUG-1995	Akshat	Rajeev	aggarwal	M	enclave	Tamil_Nadu	Vellore
T_0001	D_0006	11-AUG-1995	Abhishek	Rajeev	Sharma	M	enclave	Maharashtra	Thane

Functional dependencies:

The functional dependencies associated with the above table are:

Tax_no → DOB Fname Mname Lname Sex Street State City -----(1)

Doc_id → DOB Fname Mname Lname Sex Street State City -----(2)

Doc_id → Tax_no -----(3)

State → City -----(4)

1NF

In Relational Database Management System (RDBMS), 1NF is one of the properties a relation (table) must satisfy. A table is said to be in 1NF if it satisfies the following properties:

Property 1: Any attribute (column) of a table must have been designed to accept only atomic values.

Property 2: Any value stored in any column must have single value (no repeating values).

The above table is in 1NF as it satisfies the above two condition i.e the columns can have atomic domains only and each column of the table must not have multiple values.

2NF

From functional dependency (1) and (2) we conclude that The candidate key for the relation is {tax_no, doc_id}

Candidate key → {tax_no, doc_id}

For a table to be in 2NF, it has to satisfy the following set of properties;

Property 1: The table should satisfy all the properties of previous normal form, i.e., 1NF. In other words, the table should be in 1NF.

Property 2: There should not be any partial key dependencies. This property is not applicable for relations (tables) which have single simple attribute as Primary Key. Hence, property 2 is applicable for relations those have more than one attribute combination as Primary Key (i.e., Composite Key).

This is because, there is the possibility of some of the attributes of the table to depend on any one or all of the attributes of the composite primary key.

The above table is in 2NF as it satisfies the above two condition i.e the table is in 1NF and it has no partial key dependencies i.e all the non-prime attributes of the table are completely dependent on the candidate key.

No decomposition required.

3NF

The following are the properties to be satisfied by a table for 3NF;

Property 1: The table should be in 2NF

Property 2: There should not be any Transitive Functional Dependency, i.e., there should not be any functional dependencies like a non-key (non-prime) attribute depends on another non-key (non-prime) attributes. Simply, we need all the non-key attributes must depend on the primary key only.

The above table is not in 3NF as the **FD: State → City** violates it.

We can convert the above table into 3NF by **decomposition**:

Schema after 3NF:

MYPROFILE(Tax_no, doc_id, DOB Fname Mname Lname Sex Street State City)

Tax_no	Doc_id	DOB	Fname	Mname	Lname	Sex	Street
T_0001	D_0001	11-AUG-1995	Abhishek	Rajeev	Sharma	M	enclave
T_0002	D_0002	15-AUG-1992	Kaustubh	Shankar	Shrivastava	M	seawoods
T_0003	D_0003	08-MAY-1990	Ritwik	Arvind	Sinha	M	Powai view
T_0004	D_0004	19-JUL-1991	Aaliy	deepak	Patel	M	Chitoor_road
T_0005	D_0005	11-AUG-1995	Akshat	Rajeev	aggarwal	M	enclave
T_0001	D_0006	11-AUG-1995	Abhishek	Rajeev	Sharma	M	enclave

CITY(State,City)

State	City
Maharashtra	Thane
Maharashtra	Mumbai
Maharashtra	Mumbai
Gujarat	Surat
Tamil_Nadu	Vellore
Maharashtra	Thane

BCNF

The rule of BCNF says that:

If we have set of FDs in R such that $X \rightarrow Y$, then X must be a super key. In other words, if X is not a key, then the relation R is not in BCNF.

Since the City table has only two attributes associated with it so we don't need to check the BCNF conditions for it. Also MYPROFILE has {tax_id,Doc_id} as a key (a super key) and determines all the attributes uniquely. **Thus MYPROFILE and CITY are in BCNF.**

No decomposition of schemas required.

Final schemas after normalization:

MYPROFILE(Tax_no,doc_id,DOB Fname Mname Lname Sex Street State City)

Tax_no	Doc_id	DOB	Fname	Mname	Lname	Sex	Street
T_0001	D_0001	11-AUG-1995	Abhishek	Rajeev	Sharma	M	enclave
T_0002	D_0002	15-AUG-1992	Kaustubh	Shankar	Shrivastava	M	seawoods
T_0003	D_0003	08-MAY-1990	Ritwik	Arvind	Sinha	M	Powai view
T_0004	D_0004	19-JUL-1991	Aaliy	deepak	Patel	M	Chitoor_road
T_0005	D_0005	11-AUG-1995	Akshat	Rajeev	aggarwal	M	enclave
T_0001	D_0006	11-AUG-1995	Abhishek	Rajeev	Sharma	M	enclave

CITY(State,City)

State	City
Maharashtra	Thane
Maharashtra	Mumbai
Maharashtra	Mumbai
Gujarat	Surat
Tamil_Nadu	Vellore
Maharashtra	Thane

Final schemas of all the tables after normalization

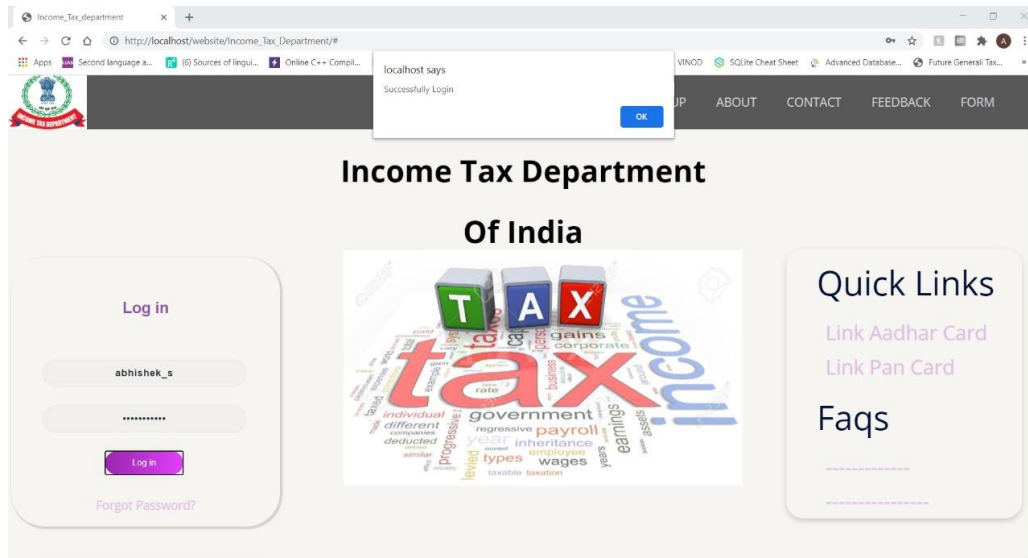

- MYPROFILE(Tax_no,doc_id,DOB Fname Mname Lname Sex Street State City)
- CITY(State,City)
- DOCUMENT(Docid,Dlife,Dtype)
- CONTACT(tax_no,phone)
- DOCUMENT_STATUS(docid,status,tax_no)
- TAX_REGISTRATION(tax_no,user_id,lname,fname,mname,password)
- DEPENDENT(tax_no,fname,mname,lname,dob,relation)
- REG_STATUS(tax_no,status,s_confirmation_date)
- ACCOUNT(Account_no,b_name)
- ACCOUNT_INFO(ifsc,account_no,type)
- BANK(Bankname,ifsc)
- PAYEE_INFO(Payment_id,Account_no,tax_id,b_name,Date)
- AMOUNT(b_name,amount)
- POLICY(tax_no, p_no)
- POLICY_DETAILS (p_no,p_type,p_name,iss_date,exp_date,iss_comp)
- SALARY_DETAILS(emp_id,emp_name,gr_sal)
- EMPLOYEE_DETAILS(emp_id,pan_no,tax_no)

IV – Phase III report

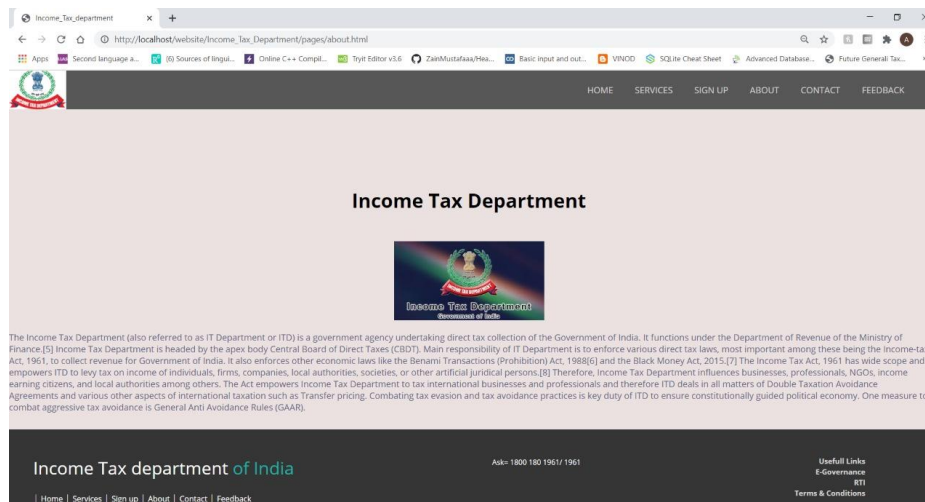

FLOW OF CONTROL AND PURPOSE OF INTERFACES

To create our website we have made use of HTML and CSS. PHP has been used to connect the database with the frontend (website/form). We have the following pages on our website:

- 1) **Home**: This is the opening page of our website from where we can navigate to all other tabs.

- 2) **About:** Displays general information about Income tax Department.

3) **Contact Us:** To help payee's resolve their queries.

The screenshot shows a web browser window with the URL `http://localhost/website/Income_Tax_Department/pages/contact.html`. The page has a dark grey header with a navigation menu: HOME, SERVICES, SIGN UP, ABOUT, CONTACT, and FEEDBACK. The main content area is light purple and features the heading "Contact Us" with a blue underline. Below the heading is a form with four input fields: "Your Name", "Your Email", "Your Phone", and "Your Message". A "send" button is located at the bottom right of the form. The footer is dark grey and contains the text "Income Tax department of India", "Ask- 1800 180 1961 / 1961", and "Usefull Links E-Governance RTI Terms & Conditions".

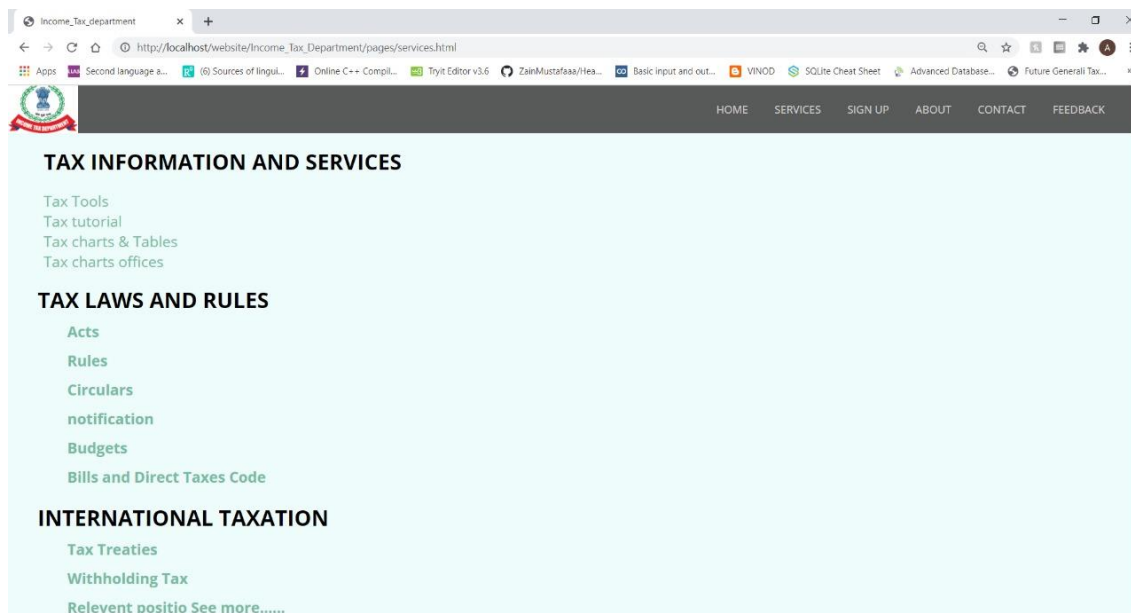

4) **Feedback:** We want to constantly improve our Income tax system, so this tab will help us take feedback from our users.

The screenshot shows a web browser window with the URL `http://localhost/website/Income_Tax_Department/pages/feedback.html`. The page has a dark grey header with a navigation menu: HOME, SERVICES, SIGN UP, ABOUT, CONTACT, and FEEDBACK. The main content area is light blue and features the heading "FEEDBACK". Below the heading is a form with four input fields: "First Name", "Last Name", "Email", and "Message". A "Submit" button is located at the bottom right of the form. The footer is dark grey and contains the text "Income Tax department of India", "Ask- 1800 180 1961 / 1961", and "Usefull Links E-Governance".

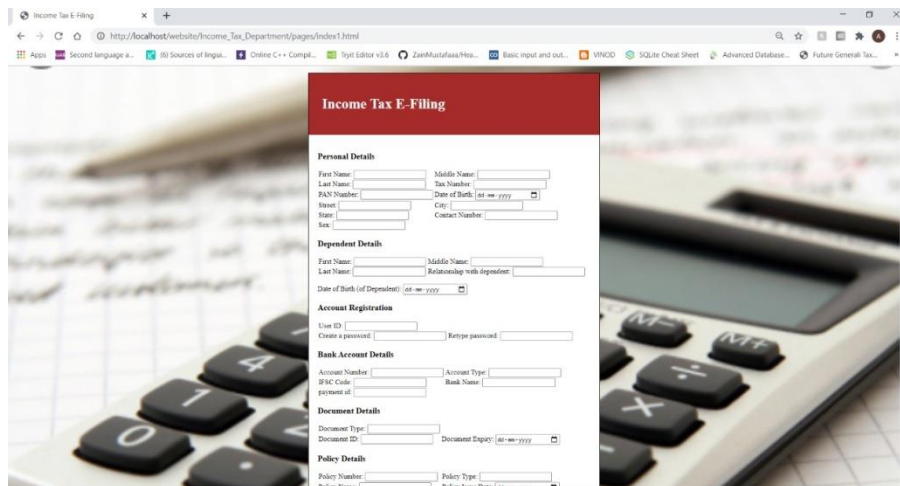

5) **Sign Up:** To allow the user to sign up an account.

The screenshot shows a web browser window with the URL `http://localhost/website/Income_Tax_Department/pages/signup.html`. The page features a dark grey header with the Income Tax Department logo on the left and navigation links (HOME, SERVICES, SIGN UP, ABOUT, CONTACT, FEEDBACK) on the right. The main content area has a light green background. In the center, there is a white sign-up form with the following fields: Full Name, Email, password, confirm-password, and Mob no. Below these fields is a green 'SIGN UP' button and a link that says 'registered? Login In'. At the bottom of the page, there is a dark grey footer containing the text 'Income Tax department of India', the toll-free number 'Ask- 1800 180 1961 / 1961', and a link for 'Usefull Links E-Governance'.

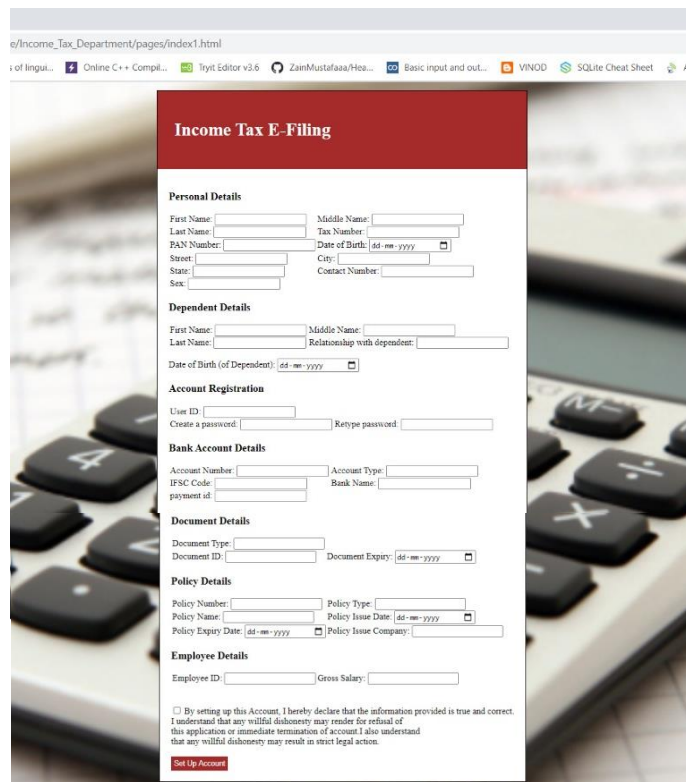

6) **Services:** This tab will hold the links of various services that are provided by the Income Tax Department of India.

- 7) **Form:** This is the main part of our project to input the information from the user. This has been designed in a user friendly way so that our users can conveniently use our website to register for their tax filing. This form has fields where the user can enter details. These details will be securely stored in the database.

The screenshot shows a web browser window with the URL `http://localhost/webiste/Income_Tax_Department/pages/index1.html`. The page displays a registration form titled "Income Tax E-Filing". The form is divided into several sections: "Personal Details" (First Name, Middle Name, Last Name, PAN Number, Date of Birth, Street, City, State, Contact Number, Sex), "Dependent Details" (First Name, Middle Name, Last Name, Relationship with dependent, Date of Birth (if Dependent)), "Account Registration" (User ID, Create a password, Retype password), "Bank Account Details" (Account Number, IFSC Code, Account Type, Bank Name, payment at), "Document Details" (Document Type, Document ID, Document Expiry), "Policy Details" (Policy Number, Policy Type, Policy Name, Policy Issue Date, Policy Expiry Date, Policy Issue Company), and "Employee Details" (Employee ID, Gross Salary). At the bottom, there is a checkbox for a declaration and a "Get Up Account" button.

This screenshot shows the same "Income Tax E-Filing" registration form, but with an additional "Employee Details" section at the bottom. It includes fields for "Employee ID" and "Gross Salary". Below this section is a declaration checkbox with the text: "By setting up this Account, I hereby declare that the information provided is true and correct. I understand that any willful dishonesty may render for refusal of this application or immediate termination of account. I also understand that any willful dishonesty may result in strict legal action." A "Get Up Account" button is located at the bottom right of the form.

We also have a set of constraints so that we get the correct information from our users.

1. Contact Number: Length should be of 10 digits only.
2. PAN Number: Length should be of 10 characters only.
3. Tax ID: Length: 5 characters and should begin with 'T'.
4. Policy no: Length: 5 characters and should begin with 'P'.
5. Emp no: Length: 5 characters and should begin with 'E'.
6. Docid: Length: 5 characters and should begin with 'D'.

Step 2: Let us input some information as a user in the form.

Income Tax E-Filing

Personal Details

First Name: [akshat] Middle Name: [rajeiv]
Last Name: [sharma] Tax Number: [T0001]
PAN Number: [ABCDE1234Z] Date of Birth: [30-06-2001]
Street: [baker street] City: [Trane]
State: [maharashtra] Contact Number: [8526756229]
Sex: [M]

Dependent Details

First Name: [Rehan] Middle Name: [rajeiv]
Last Name: [Sharma] Relationship with dependent: [son]
Date of Birth (of Dependent): [16-03-2012]

Account Registration

User ID: [akshat_s]
Create a password: [] Retype password: []

Bank Account Details

Account Number: [12255] Account Type: [Savings]
IFSC Code: [1890] Bank Name: [HDFC]
payment id: [456342]

Document Details

Document Type: [Aadhar]
Document ID: [00001] Document Expiry: [08-11-2020]

Policy Details

Policy Number: [P0001] Policy Type: [Life insurance]
Policy Name: [jeevan ayu] Policy Issue Date: [01-10-2020]
Policy Expiry Date: [08-11-2020] Policy Issue Company: [SBI]

Employee Details

Employee ID: [E0001] Gross Salary: [100000]

☒ By setting up this Account, I hereby declare that the information provided is true and correct. I understand that any willful dishonesty may render for refusal of this application or immediate termination of account. I also understand that any willful dishonesty may result in strict legal action.

Step 3: Values are stored in our database according to what the user has entered. Let us check two tables for validation if the values are properly stored or not.

The screenshot shows the phpMyAdmin interface for the 'income' database. The 'myprofile2' table is selected, and the SQL query 'SELECT * FROM `myprofile2`' is executed. The results show one row with the following data:

tax_no	doc_id	DOB	FNAME	LNAME	mname	sex	street	state
T0001	D0001	2001-06-30	akshat	sharma	rajeev	M	baker street	maharashtra

The screenshot shows the phpMyAdmin interface for the 'income' database. The 'document' table is selected, and the SQL query 'SELECT * FROM `document`' is executed. The results show one row with the following data:

DOCID	DOCTYPE	doc_exp
D0001	Aadhar	2020-11-08

We have successfully stored and registered our first user to our website.

LEARNING

Doing our project was like digging a tunnel of knowledge. We learnt many new things and how things actually work in real life. This project has helped us apply database concepts that in theory appear abstract but in real time system like in our case a tax registration system, hold utmost Importance. We realized the importance of planning the schema of our database using an ER diagram which helped us realize what the various entity sets were. It also helped us better comprehend the difference between strong entity sets and weak entity sets. Though concepts of normalization are taught well in class, the importance of normalizing tables is only understood when you work with them in real time systems. We learnt about HTML, CSS and a tad amount of JavaScript for front end web development. To implement our backend we learnt PHP, and using PHP we connected our form with the database we hosted in PhpMyAdmin. For database management, we understood SQL and used MySQL RDBMS. We also got to know about UI/UX designing. For that we used adobe XD. Overall, we are happy with the work we did and ample time we spent developing this project. We hope our efforts are realised by you as well.
